

Complex analytics on terabytes of data, in minutes

Run analytics on complex data easily, with RMS Vision

The RMS Vision structured data keyword search engine brings together high performance in-memory data associations with parallel and adaptive query processing, delivering a blisteringly fast search with greater flexibility. Detecting and recording real-world relationships, rather than row and column based associations, RMS Vision helps users make the most of data exploration - without the need for programming and development!

Scalable self-service search technology.

Spanning your organisation, RMS Vision delivers real-time self-service BI that scales from the smallest team to the largest enterprise. With breakthrough freeform search, RMS Vision allows teams of users to question organisational databases for themselves and collaborate with colleagues. As RMS Vision does not use hard-coded structures, it easily incorporates new data sources as they are added to your BI infrastructure.

Collaborative real-time discoveries.

The true nature of Social-BI is more than simply publishing and sharing reports. RMS Vision allows users to share 'canvas' areas, so that teams can develop thinking and analysis, before preparing reports for publication - saving time and duplication of effort. A secure role-based access model allows you to set pre-defined role-based access to reports, dashboards, and individual canvases, enabling team collaboration on work in progress. An audit trail of searches is logged for added control.

Analyse, Prepare and publish with a click.

RMS Vision's advanced visualisation features allow users to flip-through an interactive carousel of search results, find the information required, drag-and-drop it to a canvas and combine different sources into a single chart.

Choosing from a wide range of chart types and automatically formatting results in 2D or 3D. Teams can prepare real-time dashboards and reports, and publish at the click of a button.

Key Features:

1. Scalable load and go implementation - fast roll-out with minimal training required.
2. Natural freeform BI search - combine keywords and phrases.
3. Adapt and enhance queries - change queries mid-search to discover more.
4. In-memory search + data modeling - develop new associations between data.
5. Real-time drill-down to source detail - automatic report refresh as new data arrives.
6. Advanced Visualisation - collaborate across teams and combine search results.

Greater return on your BI investment

What makes RMS Vision different? It's true self-service BI by design

It's unlike first generation self-service tools that constrain users to predefined queries and require IT development support for anything more. Users of RMS Vision simply aren't constrained to pre-determined queries.

Traditional BI tools need significant time and resource in scoping, designing, building, and testing each new report, dashboard, or chart. This can be a process that often takes weeks. With RMS Vision it's automatic and instant, and even initial setup time is a fraction of other tools.

RMS Vision is a Breakthrough in self-service BI Access & Independence

RMS Vision is a 'load and go solution' that complements existing organisational BI infrastructure and provides easy access to source data to construct data sets or models without IT investment in terms of programming or development.

Integrate & Manage

Scalable, easy to administrate, and secure, RMS Vision enables teams of users to conduct blisteringly fast search across enterprise-wide data sources.

Analyse & Publish

Advanced data modeling delivers complex multi-dimensional freeform search capability and high performance in-memory analytics enables users to adapt queries to get rapid results. RMS Vision allows teams to collaborate on searches, analyse results across departments, and publish real-time reports that can be refreshed to a schedule.

Discover & Enhance

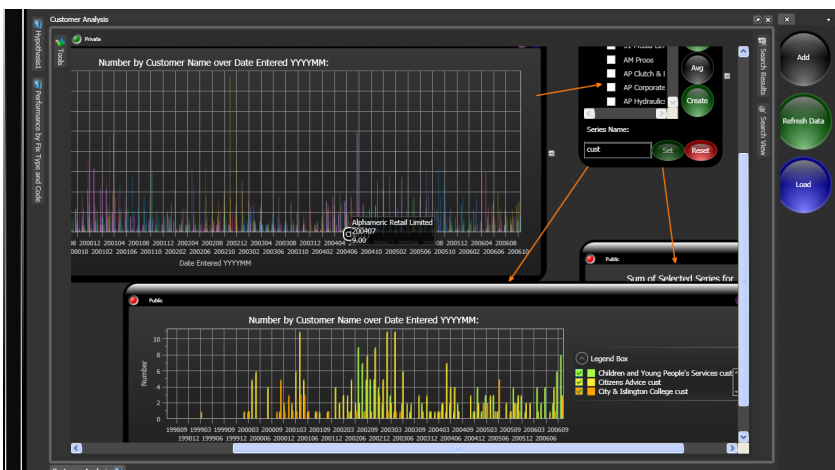

RMS Vision takes users from raw data, to discovery, in minutes – enabling teams to collaborate in order to make better decisions, faster, for rapid return on investment.

Discover More, Faster

RMS Vision's user-centric self-service capability returns control to decision makers across the organisation. When teams are looking to quantify an opportunity, and require data for further analysis, they no longer need to build a business case to involve the IT department in accessing the data and building the necessary report. Removing this step in the process supports faster decision-making and results in increased business agility. Now teams across the organisation can benefit from self-service BI search with minimal training. Enhance team collaboration [with RMS Vision - together you can discover more. Faster.](#)

Customer Benefits:

1. **True Self-Service** – Reduces operational costs, no need for an IT expert.
2. **Natural Language Search** – Easy, intuitive, and unconstrained queries allow exploration of all corporate data.
3. **Fast** – Immediate on-the-fly generation of charting means results in seconds.
4. **Powerful tiered queries** – Quickly drill down to get to the reasons underpinning results.
5. **Excellent graphical reporting** – Intuitive and powerful charting helps interpret results.
5. **Easy deployment** – Deploys in a fraction of the time, with minimal disruption, and at very competitive costs
